

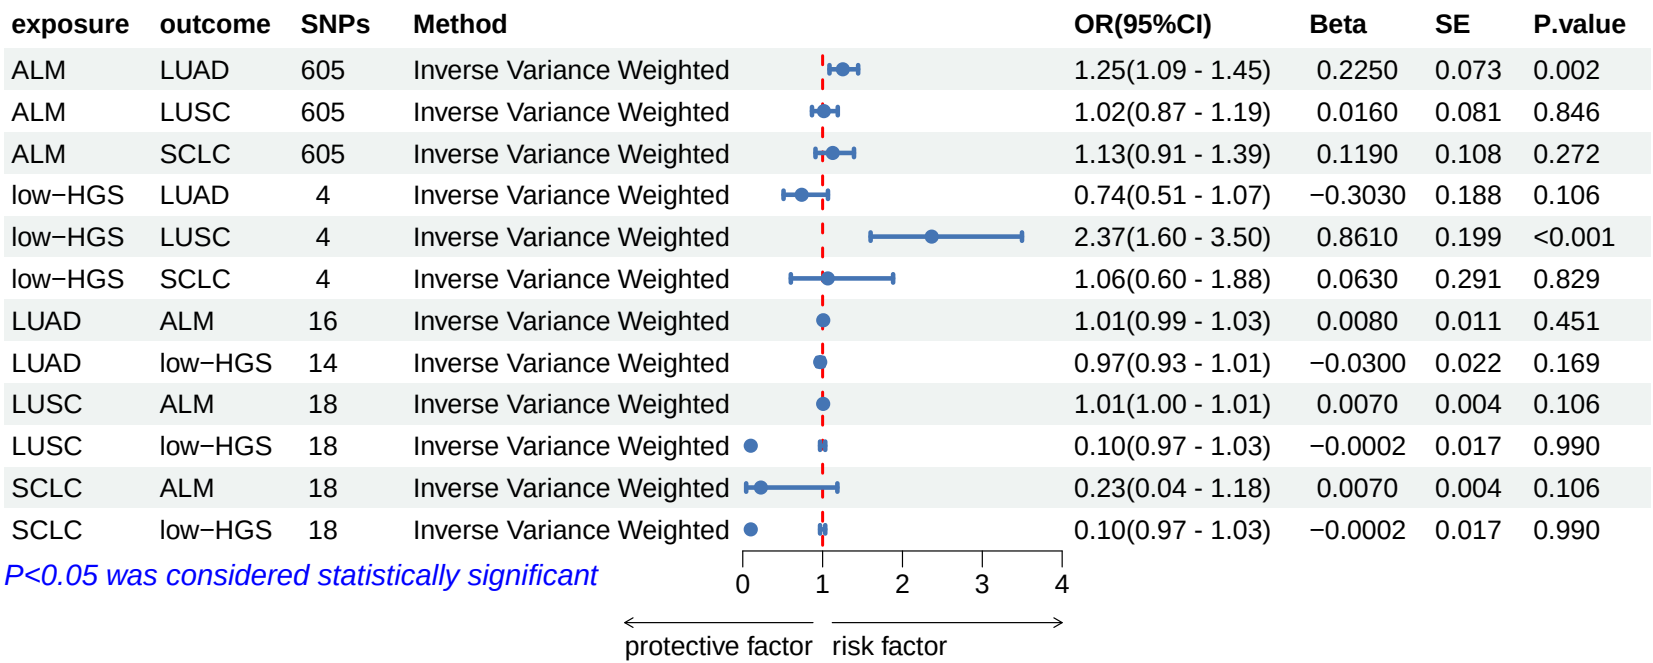

Figure 4.Mendelian Randomization Analysis of Subgroup Effects for ALM, Low-HGS, and Lung Cancer Subtypes

NOTE: Forest plot illustrating the results of Mendelian Randomization analysis for various exposures (ALM, low-HGS) and lung cancer subtypes (LUAD, LUSC, SCLC). Odds Ratios (OR) and 95% Confidence Intervals (CI) are derived using the Inverse Variance Weighted method. Significant results ($P < 0.05$) are highlighted, with $OR > 1$ indicating risk factors and $OR < 1$ indicating protective factors.
